FEMTOCLOCK™ CRYSTAL-TO-3.3V LVPECL CLOCK GENERATOR

ICS843SDN

General Description

The ICS843SDN is a Gigabit Ethernet Clock Generator. The ICS843SDN uses a 24MHz crystal to synthesize 120MHz. The ICS843SDN uses IDT's 3rd generation low phase noise VCO technology, and can achieve <1ps rms phase jitter performance over the 12kHz – 20MHz integration range. The ICS843SDN is packaged in a small 8-pin TSSOP, making it ideal for use in systems with limited board space.

Features

- One differential 3.3V LVPECL output
- Crystal oscillator interface designed for 23.2MHz – 30MHz, 18pF parallel resonant crystal
- Output frequency range: 116MHz – 150MHz
- VCO range: 580MHz – 750MHz
- Output duty cycle range: 47% – 53%
- RMS phase jitter @ 120MHz, using a 24MHz crystal (12kHz – 20MHz): 0.81ps (typical)
- Full 3.3V supply mode
- 0°C to 70°C ambient operating temperature
- Industrial temperature information available upon request
- Available in lead-free (RoHS 6) package

Table 2. Pin Descriptions

Number	Name	Type		Description
1	V$_{CCA}$	Power		Analog supply pin.
2	V$_{EE}$	Power		Negative supply pin.
3, 4	XTAL_OUT XTAL_IN	Input		Crystal oscillator interface. XTAL_IN is the input, XTAL_OUT is the output.
5	nc	Unused		No connect.
6, 7	nQ, Q	Output		Differential output pair. LVPECL interface levels.
8	V$_{CC}$	Power		Core supply pin.

Absolute Maximum Ratings

NOTE: Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device.
These ratings are stress specifications only. Functional operation of product at these conditions or any conditions beyond
those listed in the *DC Characteristics or AC Characteristics* is not implied. Exposure to absolute maximum rating conditions for
extended periods may affect product reliability.

Item	Rating
Supply Voltage, V$_{CC}$	4.6V
Inputs, V$_I$	-0.5V to V$_{CC}$+ 0.5V
Outputs, I$_O$ Continuos Current Surge Current	50mA 100mA
Package Thermal Impedance, θ_{JA}	129.5°C/W (0 mps)
Storage Temperature, T$_{STG}$	-65°C to 150°C

DC Electrical Characteristics

Table 3A. Power Supply DC Characteristics, V$_{CC}$ = 3.3V ± 5%, V$_{EE}$ = 0V, T$_A$ = 0°C to 70°C

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units
V$_{CC}$	Core Supply Voltage		3.135	3.3	3.465	V
V$_{CCA}$	Analog Supply Voltage		V$_{CC}$ – 0.10	3.3	V$_{CC}$	V
I$_{EE}$	Power Supply Current				83	mA

Table 3B. LVPECL DC Characteristics, V$_{CC}$ = 3.3V ± 5%, V$_{EE}$ = 0V, T$_A$ = 0°C to 70°C

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units
V$_{OH}$	Output High Current; NOTE 1		V$_{CC}$ – 1.4		V$_{CC}$ – 0.9	V
V$_{OL}$	Output Low Current; NOTE 1		V$_{CC}$ – 2.0		V$_{CC}$ – 1.7	V
V$_{SWING}$	Peak-to-Peak Output Voltage Swing		0.6		1.0	V

NOTE 1: Outputs termination with 50Ω to V$_{CC}$ – 2V.

Table 4. Crystal Characteristics

Parameter	Test Conditions	Minimum	Typical	Maximum	Units
Mode of Oscillation		Fundamental			
Frequency; NOTE 1		23.2		30	MHz
Equivalent Series Resistance (ESR)				40	Ω
Shunt Capacitance				7	pF

NOTE: It is not recommended to overdrive the crystal input with an external clock.
NOTE 1:Input frequency is limited to a range of 23.2MHz – 30MHz due to VCO range.

AC Electrical Characteristics

Table 5. AC Characteristics, V_{CC} = 3.3V ± 5%, V_{EE} = 0V, T_A = 0°C to 70°C

Parameter	Symbol	Test Conditions	Minimum	Typical	Maximum	Units
f_{OUT}	Output Frequency		116		150	MHz
ƒjit(Ø)	RMS Phase Jitter, Random; NOTE 1	120MHz, (Integration Range: 12kHz – 20MHz)		0.81		ps

Application Information

Power Supply Filtering Technique

As in any high speed analog circuitry, the power supply pins are vulnerable to random noise. To achieve optimum jitter perfor-mance, power supply isolation is required. The ICS843SDN pro-vides separate power supplies to isolate any high switching noise from the outputs to the internal PLL. V_{CC} and V_{CCA} should be indi-vidually connected to the power supply plane through vias, and 0.01μF bypass capacitors should be used for each pin. *Figure 1* il-lustrates this for a generic V_{CC} pin and also shows that V_{CCA} re-quires that an additional 10Ω resistor along with a 10μF bypass capacitor be connected to the V_{CCA} pin.

Figure 1. Power Supply Filtering

Crystal Input Interface

The ICS843SDN has been characterized with 18pF parallel resonant crystals. The capacitor values, C1 and C2, shown in *Figure 2* below were determined using a 25MHz, 18pF parallel resonant crystal and were chosen to minimize the ppm error. The optimum C1 and C2 values can be slightly adjusted for different board layouts.

Figure 2. Crystal Input Interface

Termination for 3.3V LVPECL Outputs

The clock layout topology shown below is a typical termination for LVPECL outputs. The two different layouts mentioned are recom-mended only as guidelines.

FOUT and nFOUT are low impedance follower outputs that gener-ate ECL/LVPECL compatible outputs. Therefore, terminating resis-tors (DC current path to ground) or current sources must be used for functionality. These outputs are designed to drive 50Ω transmis-

sion lines. Matched impedance techniques should be used to max-imize operating frequency and minimize signal distortion. *Figures 4A and 4B* show two different layouts which are recommended only as guidelines. Other suitable clock layouts may exist and it would be recommended that the board designers simulate to guarantee compatibility across all printed circuit and clock component pro-cess variations.

Figure 4B. 3.3V LVPECL Output Termination

Schematic Example

Figure 5A shows an example of the ICS843SDN application schematic. In this example, the device is operated at V_{CC} = 3.3V. The 18pF parallel resonant crystal is used. The C1 = 27pF and C2 = 27pF are recommended for frequency accuracy. For a different board layout, the C1 and C2 values may be slightly adjusted for

optimizing frequency accuracy. Two examples of LVPECL terminations are shown in this schematic. Additional approaches are shown in the LVPECL Termination Application Note.

Note: Thermal pad (E-pad) must be connected to ground (VEE).

Figure 5A. ICS843SDN Schematic Example

Schematic Example

Figure 5B shows an example of ICS843SDN P.C. board layout. The crystal X1 footprint shown in this example allows installation of either surface mount HC49S or through-hole HC49 package. The footprints of other components in this example are listed in the

Table 6 There should be at least one decoupling capacitor per power pin. The decoupling capacitors should be located as close as possible to the power pins. The layout assumes that the board has clean analog power ground plane.

Power Considerations

This section provides information on power dissipation and junction temperature for the ICS843SDN.
Equations and example calculations are also provided.

1. Power Dissipation.

The total power dissipation for the ICS843SDN is the sum of the core power plus the power dissipated in the load(s).
The following is the power dissipation for V_{CC} = 3.3V + 5% = 3.465V, which gives worst case results.

NOTE: Please refer to Section 3 for details on calculating power dissipated in the load.

- Power (core)$_{MAX}$ = V_{CC_MAX} * I_{EE_MAX} = 3.465V * 83mA = **287.60mW**
- Power (outputs)$_{MAX}$ = **30mW/Loaded Output pair**

Total Power$_{\_MAX}$ (3.3V, with all outputs switching) = 287.60mW + 30mW = **317.60mW**

2. Junction Temperature.

Junction temperature, Tj, is the temperature at the junction of the bond wire and bond pad and directly affects the reliability of the device. The maximum recommended junction temperature is 125°C.

The equation for Tj is as follows: Tj = θ_{JA} * Pd_total + T_A

Tj = Junction Temperature

θ_{JA} = Junction-to-Ambient Thermal Resistance

Pd_total = Total Device Power Dissipation (example calculation is in section 1 above)

T_A = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance θ_{JA} must be used. Assuming no air flow and a multi-layer board, the appropriate value is 129.5°C/W per Table 7 below.

Therefore, Tj for an ambient temperature of 70°C with all outputs switching is:

70°C + 0.318W * 129.5°C/W = 111.2°C. This is below the limit of 125°C.

This calculation is only an example. Tj will obviously vary depending on the number of loaded outputs, supply voltage, air flow and the type of board (multi-layer).

Table 7. Thermal Resistance θ_{JA} for 8 Lead TSSOP, Forced Convection

θ_{JA} by Velocity			
Meters per Second	**0**	**1**	**2.5**
Multi-Layer PCB, JEDEC Standard Test Boards	129.5°C/W	125.5°C/W	123.5°C/W

3. Calculations and Equations.

The purpose of this section is to derive the power dissipated into the load.

LVPECL output driver circuit and termination are shown in *Figure 6.*

Figure 6. LVPECL Driver Circuit and Termination

To calculate worst case power dissipation into the load, use the following equations which assume a 50Ω load, and a termination voltage of $V_{CC} - 2V$.

- For logic high, $V_{OUT} = V_{OH\_MAX} = \textbf{V}_{\textbf{CC\_MAX}} - \textbf{0.9V}$
  $(V_{CC\_MAX} - V_{OH\_MAX}) = \textbf{0.9V}$

- For logic low, $V_{OUT} = V_{OL\_MAX} = \textbf{V}_{\textbf{CC\_MAX}} - \textbf{1.7V}$
  $(V_{CC\_MAX} - V_{OL\_MAX}) = \textbf{1.7V}$

Pd_H is power dissipation when the output drives high.

Pd_L is the power dissipation when the output drives low.

Pd_H = $[(V_{OH\_MAX} - (V_{CC\_MAX} - 2V))/R_L] * (V_{CC\_MAX} - V_{OH\_MAX}) = [(2V - (V_{CC\_MAX} - V_{OH\_MAX}))/R_L] * (V_{CC\_MAX} - V_{OH\_MAX}) = [(2V - 0.9V)/50Ω] * 0.9V = \textbf{19.8mW}$

Pd_L = $[(V_{OL\_MAX} - (V_{CC\_MAX} - 2V))/R_L] * (V_{CC\_MAX} - V_{OL\_MAX}) = [(2V - (V_{CC\_MAX} - V_{OL\_MAX}))/R_L] * (V_{CC\_MAX} - V_{OL\_MAX}) = [(2V - 1.7V)/50Ω] * 1.7V = \textbf{10.2mW}$

Total Power Dissipation per output pair = Pd_H + Pd_L = **30mW**
