MIC26601 Evaluation Board

28V, 6A HyperLight Load® Synchronous DC-DC Buck Regulator

SuperSwitcher IIG

General Description

The MIC26601 DC-DC regulator operates over an input supply range of 4.5V to 28V and provides a regulated output at up to 6A of output current. The output voltage is adjustable down to 0.8V with a typical accuracy of ±1% and the device operates at a switching frequency of 600kHz. The switching frequency remains fairly constant with changes in input voltage and output load.

Micrel's Hyper Speed Control™ architecture allows for ultra-fast transient response while reducing the output capacitance and also makes (High V_{IN})/(Low V_{OUT}) operation possible. The MIC26601 utilizes an adaptive T_{ON} ripple control architecture. An undervoltage lockout feature is provided to ensure proper operation under power-sag conditions. An internal soft-start feature is provided to reduce the inrush current. Fold-back current limit and "hiccup" mode short-circuit protection and thermal shutdown ensures protection of the IC during fault conditions.

Note: This evaluation board is for 6A applications.

Datasheet and supporting documentation can be found on Micrel's web site at: www.micrel.com.

Requirements

The MIC26601 provides a 5V regulated output for input voltage V_{IN} ranging from 5.5V to 28V. When V_{IN} < 5.5V, VDD should be tied to PVIN pins to bypass the internal linear regulator by a jumper. The output load can either be an active or passive load.

Precautions

The evaluation board does not have reverse polarity protection. Applying a negative voltage to the V_{IN} terminal may damage the device. In addition, the maximum V_{IN} operating voltage of the MIC26601 evaluation board is 28V. Exceeding 29V on VIN could damage the device.

Getting Started

1. **Connect an external supply to the V_{IN} terminal.** Apply the desired input voltage to the V_{IN} and ground terminals of the evaluation board, paying careful attention to polarity and supply voltage. An ammeter may be placed between the input supply and the V_{IN} terminal to the evaluation board. Ensure that the supply voltage is monitored at the V_{IN} terminal. The ammeter and/or power lead resistance can reduce the voltage supplied to the input.

2. **Connect the load to the V_{OUT} and ground terminals.** The load can be either passive (resistive) or active (as in an electronic load). An ammeter can be placed between the load and the V_{OUT} terminal. Ensure that the output voltage is monitored at the V_{OUT} terminal. V_{OUT} can be set to 0.9V, 1.0V, 1.2V, 1.5V, 1.8V, 2.5V, 3.3V, or 5.0V by a jumper. If a different voltage is needed, it can be adjusted by changing the feedback resistors. See "Output Voltage" section.

3. **Enable the MIC26601**. The EN pin is provided on the evaluation board. The output of the MIC26601 turns on when V_{DD} exceeds the UVLO threshold. The output of the MIC26601 may be turned off by shorting the EN pin to ground. A connection on the board provides easy access to the enable pin.

Ordering Information

Part Number	Description
MIC26601YJL EV	HSC 6A DC-DC Regulator Evaluation Board

Output Voltage

The output voltage on the MIC26601 evaluation board is adjustable. It is set by adjusting the feedback resistors (R4 and one of R5, R6, R7, R8, R9, R10, R11, or R12) and can be calculated as follows as an example:

$$V_{OUT} = V_{REF} \times (1 + \frac{R4}{R7})$$

where V_{REF} = 0.8V.

The output voltage above is set at the factory for a 1.2V output, but it can easily be changed by moving the jumper to a respective position to get an indicated voltage on the board. If a desired voltage is not shown on the board, it is easily modified by removing R4 and R7 and replacing them with the values that yield the desired output voltage. Once R4 is selected, R7 can be calculated using:

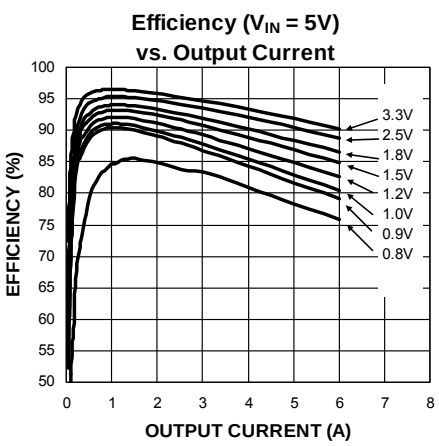
$$R7 = \frac{R4 \times V_{REF}}{V_{OUT} - V_{REF}}$$

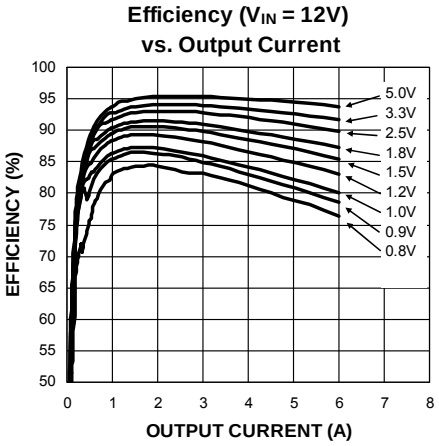
For V_{REF} = 0.8V:

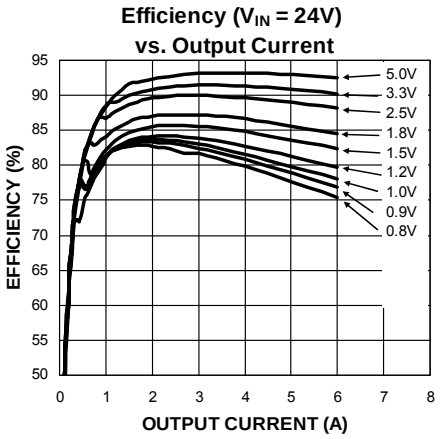
$$R7 = \frac{R4 \times 0.8V}{V_{OUT} - 0.8V}$$

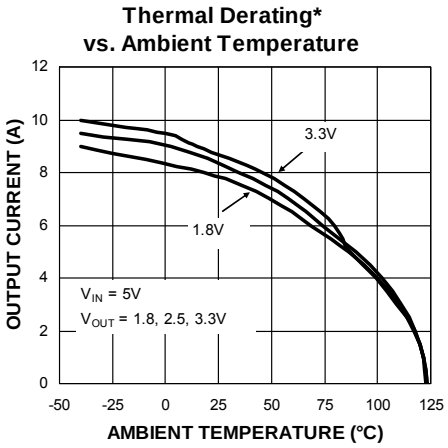
The output voltage should not be set to exceed 5V due to the 6.3V rating of the output capacitor and limitation on line regulation. Please refer to the MIC26601 datasheet “Setting Output Voltage” section for more information.

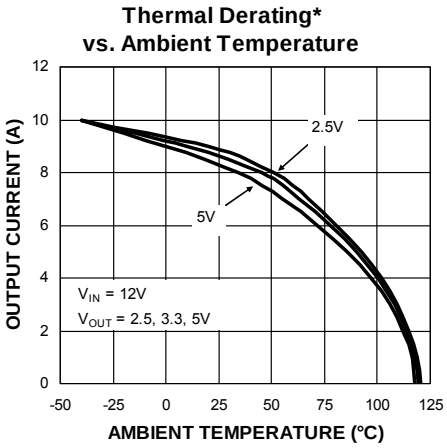
Evaluation Board Performance

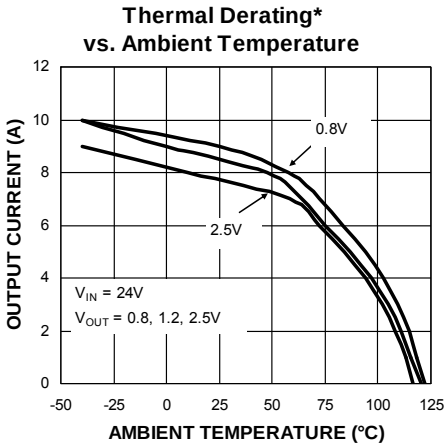












Die Temperature* : The temperature measurement was taken at the hottest point on the MIC26601 case mounted on a 5 square inch 4 layer, 0.62", FR-4 PCB with 2oz finish copper weight per layer, see Thermal Measurement section. Actual results will depend upon the size of the PCB, ambient temperature and proximity to other heat emitting components.
